Base station wind power supply load voltage

Overview

What is a base load power station?

The total load on a power station consists of two parts viz., base load and peak load. In order to achieve overall economy, the best method to meet load is to interconnect two different power stations. The more efficient plant is used to supply the base load and is known as base load power station.

What is the difference between base load and peak load power station?

The more efficient plant is used to supply the base load and is known as base load power station. The less efficient plant is used to supply the peak loads and is known as peak load power station. There is no hard and fast rule for selection of base load and peak load stations as it would depend upon the particular situation.

Does wind power affect base load?

Wind power has no effect on base load. However, since base load providers can not be ramped down, if wind turbines produce power when there is no or little peak load, the extra electricity has to be dumped (e.g., into the ground) or the wind turbines turned off ("curtailment"). How does wind power affect peak load?

.

How do we reduce wind load in base station antennas?

To reduce wind load in base station antenna designs, the key is to delay flow separation and reduce wake. This equation can be simplified, as only the third term on each side is related to pressure drag. Furthermore, force is related to pressure: How do we reduce wind load for base station antennas?

.

Are Andrew's base station antennas aerodynamic?

Andrew's re-designed base station antennas are crafted to be exceptionally aerodynamic, minimizing the overall wind load imposed on a cellular tower or similar structures. Wind load is the force generated by wind on the exterior surfaces of an object.

What is a base load?

1. Base load. The unvarying load which occurs almost the whole day on the station is known as base load. Referring to the load curve of Fig. 3.13, it is clear that 20 MW of load has to be supplied by the station at all times of day and night i.e. throughout 24 hours. Therefore, 20 MW is the base load of the station.
