

## SolarTech Power Solutions

# Batteries compared to vanadium flow batteries

## Overview

---

What is a vanadium flow battery?

Vanadium flow battery is a new type of energy storage battery, which has the advantages of long service life, high energy conversion efficiency, flexible design and large energy storage, and it has deep discharge, low maintenance cost, efficient and convenient thermal management.

What is the difference between vanadium redox flow battery vs lithium ion battery?

The differences between vanadium redox flow battery vs lithium ion battery are summarized as below from the aspects of structure, working principle, safety, cycle life and costs. Lithium battery consists of a positive electrode, a negative electrode, an electrolyte and a diaphragm.

What is the difference between a flow battery and a lithium battery?

Unlike lithium batteries, the electrolyte of the flow battery and the pile are separated, because the electrolyte ions of the vanadium flow battery exist in an aqueous solution, there will be no thermal runaway, overheating combustion and explosion.

What is the energy density of vanadium redox flow battery?

At present, the energy density of vanadium redox flow battery is less than 50Wh/kg, which has a large gap with the energy density of 160Wh/kg lithium iron phosphate, coupled with the flow system, so the volume of vanadium flow batteries is much larger than other batteries, often stored in containers or even buildings, and cannot be easily moved.

How much does a vanadium redox flow battery cost?

Vanadium redox flow battery (VRFB) systems come with a price tag of around £405 per kWh, which might seem steep at first glance. VRFBs shine when it comes to lifespan, lasting an impressive 25 years or more, which is way longer

than the 7 to 10 years you'd expect from lithium-ion batteries.

Can a vanadium redox flow battery explode?

This characteristic makes vanadium redox flow battery greatly reduce the risk of overheating and resulting in explosion compared with lithium-ion batteries. It is said that as long as it is properly managed, there is almost no risk of explosion in vanadium redox flow battery.
