Comparison of wind and solar complementary construction for communication base stations

Overview

What is the complementary coefficient between wind power stations and photovoltaic stations?

Utilizing the clustering outcomes, we computed the complementary coefficient R between the wind speed of wind power stations and the radiation of photovoltaic stations, resulting in the following complementary coefficient matrix (Fig. 17.).

Is there a complementarity between wind and solar energy?

Studying the complementarity between wind and solar energy is crucial for optimizing the use of these renewable resources. Multi-energy compensation systems need to consider multiple metrics, and current research relies on the correlation of single metrics to study this complementarity.

Which cluster of wind power stations exhibit the weakest complementarity with radiation?

Analysis of the matrix reveals that the 4th, 5th, 7th, and 8th clusters of wind power stations exhibit the weakest complementarity with the radiation of photovoltaic stations. In contrast, the 5th, 7th, 8th, and 10th clusters of photovoltaic stations similarly demonstrate poor complementarity with the wind speed of wind power stations.

How do we evaluate the complementarity of solar and wind energy systems?

The complementarity of solar and wind energy systems is mostly evaluated using traditional statistical methods, such as correlation coefficient, variance, standard deviation, percentile ranking, and mean absolute error, to assess the complementarity of the resources in the review.

Can combined wind and solar generate a smoother power supply?

Combined wind and solar power generation results in smoother power supply in many places, according to a review of state-of-the-art approaches in the

literature survey. Solar and wind are free, renewable, and geographically spread sources of energy.

How to measure complementarity between wind speed and radiation?

The Kendall CC, Spearman CC, and fluctuation coefficient are combined to construct a comprehensive measure of the complementarity between wind speed and radiation, which provides a reliable tool for quantitatively evaluating the complementary characteristics of wind and solar energy. 2. A copula-based wind-solar complementarity coefficient R
