

**SolarTech Power Solutions**

# **High-frequency inverter increases output power**

## Overview

---

What is a high frequency inverter?

In many applications, it is important for an inverter to be lightweight and of a relatively small size. This can be achieved by using a High-Frequency Inverter that involves an isolated DC-DC stage (Voltage Fed Push-Pull/Full Bridge) and the DC-AC section, which provides the AC output.

What are the advantages of high frequency inverters?

**Volume and weight:** Since high frequency inverters use high-frequency switching technology and compact circuit design, their size and weight are usually much smaller than power frequency inverters. This gives high frequency inverters significant advantages in mobile power supplies, aerospace, electric vehicles, and other fields.

Why are frequency drive inverters more efficient?

**Efficiency and energy consumption:** Because frequency drive inverters use high-frequency switching technology, their switching losses and iron losses are relatively small, so their efficiency is usually higher than that of power frequency inverters.

Why do high frequency inverters have distortion and harmonic content?

Due to factors such as the nonlinear characteristics of the high-frequency switching tube and the parasitic parameters of the high-frequency transformer, the output waveform of the high frequency inverter may have certain distortion and harmonic content.

How does a power frequency inverter work?

Its working principle is to convert DC power into AC power with the same frequency and phase as the power grid through an internal power conversion circuit. Power frequency inverters mostly use traditional components such as transformers and inductors to convert voltage and current.

What determines the output frequency of a high-frequency inverter?

The output frequency depends on how fast the switches cycle on and off. Common high-frequency inverter circuit configurations include: Key design factors for high-frequency inverters: Switching frequency – Higher frequency allows smaller filter components but increases losses. Optimize based on tradeoffs.
