How big a solar panel should I use to charge a 38A lead-acid battery

Overview

You need around 200-300 watts of solar panels to charge most of the 12V lead-acid batteries from 50% depth of discharge in 6 peak sun hours with an MPPT charge controller.

You need around 200-300 watts of solar panels to charge most of the 12V lead-acid batteries from 50% depth of discharge in 6 peak sun hours with an MPPT charge controller.

Use our solar panel size calculator to find out what size solar panel you need to charge your battery in desired time. Simply enter the battery specifications, including Ah, volts, and battery type. Also the charge controller type and desired charge time in peak sun hours into our calculator to get.

A Solar Panel and Battery Sizing Calculator is an invaluable tool designed to help you determine the optimal size of solar panels and batteries required to meet your energy needs. By inputting specific details about your energy consumption, this calculator provides tailored insights into the solar.

Determine Battery Capacity: Match the solar panel size to your battery's capacity, typically measured in amp-hours (Ah), to ensure effective charging. **Assess Daily Energy Needs:** Calculate the total wattage of devices you intend to power to choose a solar panel that meets or exceeds this daily.

You just input how many volt battery you have (12V, 24V, 48V) and type of battery (lithium, deep cycle, lead-acid), and how quickly you want the battery to be charged, and the calculator will automatically determine the solar panel size (wattage) you need. [Chart Of What Size Solar Panel Is Needed.](#)

Many battery manufacturers recommend a maximum charge current of for lead acid batteries with this capacity. To maximize your battery's lifespan, consider using a smaller solar panel or a bigger battery. Or increase your desired charge time. **Warning:** We estimate that a solar power system with these.

Reality check: If your lead-acid battery is labeled 10 kWh, you really only get 5

kWh of usable storage. You'll need fewer panels for lithium, significantly more for lead-acid. 3. Charging Speed Requirements Scenario A: You want to fully charge by noon to take advantage of afternoon time-of-use.
