How to calculate the approved power consumption of 5G base station power supply

Overview

How much energy does a 5G base station consume?

Because it is estimated that in 5G, the base station's density is expected to exceed 40–50 BSs/ Km². The energy consumption of the 5G network is driving attention and many world-leading network operators have launched alerts about the increased power consumption of the 5G mobile infrastructure.

Should power consumption models be used in 5G networks?

This restricts the potential use of the power models, as their validity and accuracy remain unclear. Future work includes the further development of the power consumption models to form a unified evaluation framework that enables the quantification and optimization of energy consumption and energy efficiency of 5G networks.

Are 5G radio access networks energy-efficient?

Various 5G enabled scenarios, such as, the impact of traffic load variations, the number of antennas of HPN, variation in bandwidth, and density of LPNs in mm-wave communication is considered to investigate the power requirements and network power efficiency of these radio access architectures to propose the energy-efficient radio access network.

Is artificial neural networks a good power consumption model for 5G AAUs?

In this paper, we present a power consumption model for 5G AAUs based on artificial neural networks. We demonstrate that this model achieves good estimation performance, and it is able to capture the benefits of energy saving when dealing with the complexity of multi-carrier base stations architectures.

How to reduce the power consumption of a 5G PA module?

Due to the vast 5G traffic and maintaining the QoS of the users, the artificial intelligence approach should be integrated for intelligent decision-making. To

reduce the PA module power consumption, the symbol switching off function may assist in energy saving during low traffic loads.

Why is energy consumption growth important for 5G mobile network infrastructure?

Energy consumption growth of the fifth-generation (5G) mobile network infrastructure can be significant due to the increased traffic demand for a massive number of end-users with increasing traffic volume, user density, and data rate.
