Moldova wind power project supporting energy storage

Overview

Moldova is preparing for its second major renewable energy auction in autumn 2025, this time focusing on onshore wind farms equipped with integrated battery energy storage systems (BESS), following the successful spring auction that concentrated on solar and wind.

Moldova is preparing for its second major renewable energy auction in autumn 2025, this time focusing on onshore wind farms equipped with integrated battery energy storage systems (BESS), following the successful spring auction that concentrated on solar and wind.

Moldova's proactive measures, supported by EU partnerships and strategic investments, are steering the country toward a more resilient and diversified energy future, reducing its vulnerability to external pressures and aligning with European energy standards. Preparing for the 2nd annual Moldova.

Moldova is preparing for its second major renewable energy auction in autumn 2025, this time focusing on onshore wind farms equipped with integrated battery energy storage systems (BESS), following the successful spring auction that concentrated on solar and wind. In spring 2025, the Moldovan.

A key innovation is the link between new wind capacity and battery energy storage systems. This will ensure renewable power can be securely integrated into the grid, reducing congestion and energy losses while boosting system resilience. In particular, the decision sets a maximum capacity quota of.

The Republic of Moldova is entering a new phase in its energy transition, banking on renewables and storage technologies to ensure its independence, stability and competitiveness. The Chisinau authorities are announcing a public tender this autumn for hybrid projects – wind power and photovoltaics.

en decrease to around 1 800 ktoe in 2050. This decrease will be marked by an accelerated reduction in the consumpt issioning of storag ors must install a Battery Energy erage: Supp order according to the distribution STRY OF EN .

Moldova possesses a promising wind regime suitable for generating electricity

through wind turbines. Wind data analysis and wind resource maps reveal favorable wind speeds across several regions in the country, particularly in the northern and central parts. These wind resources offer significant.
