Portable emergency flywheel energy storage

LFP 48V 100Ah

Overview

A typical system consists of a flywheel supported by connected to a . The flywheel and sometimes motor-generator may be enclosed in a to reduce friction and energy loss. First-generation flywheel energy-storage systems use a large flywheel rotating on mechanical bearings. Newer systems use composite

Flywheel systems store energy by spinning a rotor at high speeds and converting rotational energy into electricity when needed. These systems offer fast response times, high power density, and long cycle life. They can help bridge temporary power gaps and stabilize the grid during emergencies.
