

SolarTech Power Solutions

The more light the solar panel transmits

Overview

When photons, particles of light, strike the solar cell, they can be absorbed if their energy matches or exceeds the band gap energy. Shorter wavelengths, such as UV and blue light, carry higher energy photons. Silicon solar cells are efficient at absorbing these shorter wavelengths.

When photons, particles of light, strike the solar cell, they can be absorbed if their energy matches or exceeds the band gap energy. Shorter wavelengths, such as UV and blue light, carry higher energy photons. Silicon solar cells are efficient at absorbing these shorter wavelengths.

When light shines on a photovoltaic (PV) cell – also called a solar cell – that light may be reflected, absorbed, or pass right through the cell. The PV cell is composed of semiconductor material; the “semi” means that it can conduct electricity better than an insulator but not as well as a good.

from the sun, a 100-watt incandescent lamp can serve as an alternative. Keep any lamp at least a mirror and aluminum foil should show the highest level of reflection. Window glass and clear plastic sheeting should show the highest level of transmission. The mirror, aluminum foil, copper heating.
